

Mousticool: how to use it well ?

How is it different?

Most of the products traditionally used against mosquitoes are effective, but they are dangerous both for health and for the environment, because they contain harmful chemicals: they are biocides. These substances, which are toxic to living beings, kill mosquitoes but also affect the health of the people who use them.

This is why Toofruit has developed Mousticool, a moisturizing lotion that is not a biocide, but instead uses the power of plants and essential oils to keep mosquitoes away without killing them. Developed with respect for the skin and the environment, it perfectly suits the skin of both children and adults.

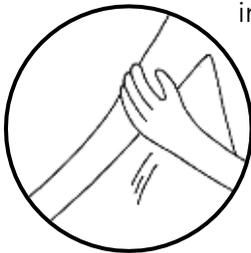

How does it work?

Mousticool is formulated from essential oils known for their repulsive properties. They are carefully dosed to respect the skin while being effective. It also contains Catalpa extract, a tree traditionally used to keep mosquitoes away, loaded with repellent active ingredients. Finally, its complex of fatty substances and polysaccharides ensures a good persistence on the skin, for a long-lasting effectiveness. For an optimal protection, it is recommended to repeat the application every 2 hours!

Is it effective?

The effectiveness of Mousticool has been demonstrated by the Arm in Cage test: it reduces the number of bites by 95% on application and by 74% two hours after application. For an effective protection, it is recommended to apply Mousticool on the entire surface of the skin, in areas not covered by clothing. It is also necessary to wait 15 minutes for the protection to be optimal.

Mousticool is easily applied, thanks to its film-forming aspect, just as easy as a sun care product or a moisturizing body cream. It is important that it covers the entire surface of the exposed skin because, unlike traditional mosquito repellents, it does not kill mosquitoes but it does deter them from landing on the skin and biting the protected areas!
