

Mousticool

MY HYDRATING PERFUMED LOTION LEMON & CATALPA

Keeps mosquitoes away

Reduces the number of mosquito bites up to 8 hours

Hydrates and perfumes the skin

Body

Moisturizing repellent lotion certified organic, specifically designed for children. The synergy of active ingredients - essential oils and Catalpa extract - helps naturally to keep mosquitoes away. The complex of fatty substances and polysaccharides allows a good remanence on the skin for a long-lasting protection, up to 8h. Its light formula does not stick, does not grease the skin and penetrates quickly. It leaves the skin soft, perfumed and protected.

How do I use it?

When mosquitoes are around, I shake the bottle and spray the lotion on my skin. I massage it into my skin to help it penetrate. I don't forget to apply it on my neck and behind my ears. For a better protection, I renew the application every 2 hours.

How does it work?

- Essential oil complex: Essential oils of Peppermint, Geranium bourbon, Lemongrass, Lavender and Lemon Eucalyptus are well known for their repellent properties. They have been carefully selected and dosed for use on children's skin.
- Catalpa is a tree native to North America, traditionally planted in gardens, near waterways or swamps infested with mosquitoes. It is loaded with mosquito repellent active ingredients.
- Lemon water is naturally known to keep mosquitoes away, while moisturizing the skin.
- Polysaccharides and vegetable oils: the complementarity of the polysaccharides and fatty substances allows remanence on the skin, for a long-term effectiveness, and comfort with the use by creating a protective barrier on the skin.

Proven effectiveness:

The effectiveness of Mousticool is proven by the test "Arm in cage". It allows to evaluate the repulsive efficiency of a product, according to the recommendations of the WHO. An arm covered with lotion is introduced every hour in a cage containing female mosquitoes. The number of probing (mosquito bite attempts) is counted for 3 minutes. The percentage of protection indicates the reduction in the number of bite attempts compared to the untreated arm.

Effectiveness on application: 95% protection*

After 2 hours: 74% protection* and 71%* extra hydration**

After 4 hours: 57% protection and 60% extra hydration**

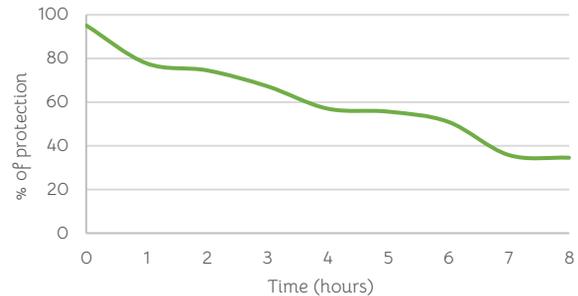

The product has a fluid and light texture: 100%***

The product spreads well: 100%***

The product penetrates quickly: 100%***

The skin is soft: 95%***

The skin is protected: 95%***

*Average percentage of protection calculated from the arm in cage test conducted on 5 subjects with *Aedes albopictus* (tiger mosquito).

**Percentage of increase in the degree of hydration of the skin on 11 volunteers.

***Percentage of satisfaction: Use test under dermatological control on 21 volunteers with sensitive skin, use once a day for 28 days.
